INVESTOR IN PEOPLE

**PRIORITY  
DOCUMENT**SUBMITTED OR TRANSMITTED IN  
COMPLIANCE WITH RULE 17.1(a) OR (b)

REC'D 06 FEB 2004  
WIPO

The Patent Office  
Concept House  
Cardiff Road  
Newport  
PC South Wales  
NP10 8QQ

EP/03/14556

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Signed

Dated 13 November 2003

## Warning

After an application for a Patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission unless an application has been filed at least six weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

## Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- For details of the fee and ways to pay please contact the Patent Office.

### Novel Compounds

The present invention relates to novel benzazepine derivatives having pharmacological activity, processes for their preparation, to compositions containing them and to their use in the treatment of neurological and psychiatric disorders.

JP 2001226269 and WO 00/23437 (Takeda Chem Ind Ltd) describe a series of benzazepine derivatives which are claimed to be useful in the treatment of obesity. DE 2207430, US 4,210,749 and FR 2171879 (Pennwalt Corp) and GB 1268243 (Wallace and Tiernan Inc) all describe a series of benzazepine derivatives which are claimed as being antagonists for narcotics (such as morphine or codeine) and also anti-histamines and anticholinergic agents. WO 02/14513 (Takeda Chem Ind Ltd) describe a series of benzazepine derivatives with GPR12 activity which are claimed to be useful in the treatment of attention deficit disorder, narcolepsy or anxiety. WO 02/02530 (Takeda Chem Ind Ltd) describe a series of benzazepine derivatives as GPR14 antagonists which are claimed to be useful in the treatment of hypertension, atherosclerosis and cardiac infarction. WO 01/03680 (Isis Innovation Ltd) describe a series of benzazepine derivatives which are claimed as effective agents in the preparation of cells for transplantation in addition to the inhibition of diseases such as diabetes. WO 00/21951 (SmithKline Beecham plc) discloses a series of tetrahydrobenzazepine derivatives as modulators of dopamine D3 receptors which are claimed to be useful as antipsychotic agents.

The histamine H3 receptor is predominantly expressed in the mammalian central nervous system (CNS), with minimal expression in peripheral tissues except on some sympathetic nerves (Leurs *et al.*, (1998), Trends Pharmacol. Sci. 19, 177-183). Activation of H3 receptors by selective agonists or histamine results in the inhibition of neurotransmitter release from a variety of different nerve populations, including histaminergic and cholinergic neurons (Schlicker *et al.*, (1994), Fundam. Clin. Pharmacol. 8, 128-137). Additionally, *in vitro* and *in vivo* studies have shown that H3 antagonists can facilitate neurotransmitter release in brain areas such as the cerebral cortex and hippocampus, relevant to cognition (Onodera *et al.*, (1998), In: The Histamine H3 receptor, ed Leurs and Timmerman, pp255-267, Elsevier Science B.V.). Moreover, a number of reports in the literature have demonstrated the cognitive enhancing properties of H3 antagonists (e.g. thioperamide, clobenpropit, ciproxifan and GT-2331) in rodent models including the five choice task, object recognition, elevated plus maze, acquisition of novel task and passive avoidance (Giovanni *et al.*, (1999), Behav. Brain Res. 104, 147-155). These data suggest that novel H3 antagonists such as the current series could be useful for the treatment of cognitive impairments in diseases such as Alzheimer's disease and related neurodegenerative disorders.

The present invention provides, in a first aspect, a compound of formula (I) or a pharmaceutically acceptable salt thereof:

wherein:

R<sup>1</sup> represents -C<sub>3-7</sub> cycloalkyl optionally substituted by C<sub>1-3</sub> alkyl;

- 5 R<sup>2</sup> represents -C<sub>1-6</sub> alkyl, -X-C<sub>3-8</sub> cycloalkyl, -X-aryl, -X-heterocyclyl, -X-heteroaryl, -X-C<sub>3-8</sub> cycloalkyl-Y-C<sub>3-8</sub> cycloalkyl, -X-C<sub>3-8</sub> cycloalkyl-Y-aryl, -X-C<sub>3-8</sub> cycloalkyl-Y-heteroaryl, -X-C<sub>3-8</sub> cycloalkyl-Y-heterocyclyl, -X-aryl-Y-C<sub>3-8</sub> cycloalkyl, -X-aryl-Y-aryl, -X-aryl-Y-heteroaryl, -X-aryl-Y-heterocyclyl, -X-heteroaryl-Y-C<sub>3-8</sub> cycloalkyl, -X-heteroaryl-Y-aryl, -X-heteroaryl-Y-heteroaryl, -X-heteroaryl-Y-heterocyclyl, -X-heterocyclyl-Y-C<sub>3-8</sub> cycloalkyl, -X-heterocyclyl-Y-aryl, -X-heterocyclyl-Y-heteroaryl, -X-heterocyclyl-Y-heterocyclyl;

X represents a bond or C<sub>1-6</sub> alkyl;

Y represents a bond, C<sub>1-6</sub> alkyl, CO, O or SO<sub>2</sub>;

R<sup>3</sup> represents halogen, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy, cyano, amino or trifluoromethyl;

n is 0, 1 or 2;

- 15 wherein said C<sub>1-6</sub> alkyl, C<sub>3-8</sub> cycloalkyl, aryl, heteroaryl and heterocyclyl groups of R<sup>2</sup> may be optionally substituted by one or more substituents (eg. 1, 2 or 3) which may be the same or different, and which are selected from the group consisting of halogen, hydroxy, cyano, nitro, oxo, trifluoromethyl, trifluoromethoxy, fluoromethoxy, difluoromethoxy, C<sub>1-6</sub> alkyl, pentafluoroethyl, C<sub>1-6</sub> alkoxy, arylC<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkylthio, C<sub>1-6</sub> alkoxyC<sub>1-6</sub> alkyl, C<sub>3-7</sub> cycloalkylC<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkanoyl, C<sub>1-6</sub> alkoxy carbonyl, C<sub>1-6</sub> alkylsulfonyl, C<sub>1-6</sub> alkylsulfinyl, C<sub>1-6</sub> alkylsulfonyloxy, C<sub>1-6</sub> alkylsulfonylC<sub>1-6</sub> alkyl, sulfonyl, arylsulfonyl, arylsulfonyloxy, arylsulfonylC<sub>1-6</sub> alkyl, aryloxy, C<sub>1-6</sub> alkylsulfonamido, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> alkylamido, -R<sup>4</sup>, -CO<sub>2</sub>R<sup>4</sup>, -COR<sup>4</sup>, C<sub>1-6</sub> alkylsulfonamidoC<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkylamidoC<sub>1-6</sub> alkyl, arylsulfonamido, arylcarboxamido, arylsulfonamidoC<sub>1-6</sub> alkyl, arylcarboxamidoC<sub>1-6</sub> alkyl, aroyl, aroylC<sub>1-6</sub> alkyl, arylC<sub>1-6</sub> alkanoyl, or a group -NR<sup>5</sup>R<sup>6</sup>, -C<sub>1-6</sub> alkyl-NR<sup>5</sup>R<sup>6</sup>, -C<sub>3-8</sub> cycloalkyl-NR<sup>5</sup>R<sup>6</sup>, -CONR<sup>5</sup>R<sup>6</sup>, -NCOR<sup>5</sup>R<sup>6</sup>, -NSO<sub>2</sub>R<sup>5</sup>R<sup>6</sup>, -OCONR<sup>5</sup>R<sup>6</sup>, -NCO<sub>2</sub>R<sup>5</sup>R<sup>6</sup>, -NCONR<sup>5</sup>R<sup>6</sup> or -SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup> (wherein R<sup>4</sup>, R<sup>5</sup> and R<sup>6</sup> independently represent hydrogen, C<sub>1-6</sub> alkyl, -C<sub>3-8</sub> cycloalkyl, aryl, heterocyclyl or heteroaryl or -NR<sup>5</sup>R<sup>6</sup> may represent a heterocyclyl group, wherein said R<sup>4</sup>, R<sup>5</sup> and R<sup>6</sup> groups may be optionally substituted by one or more substituents (eg. 1, 2 or 3) which may be the same or different, and which are selected from the group consisting of halogen, hydroxy, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy, cyano, amino, oxo or trifluoromethyl);
- 30 or solvates thereof.

- 35 Alkyl groups, whether alone or as part of another group, may be straight chain or branched and the groups alkoxy and alkanoyl shall be interpreted similarly. Alkyl moieties are more preferably C<sub>1-4</sub> alkyl, eg. methyl or ethyl. The term 'halogen' is used herein to describe, unless otherwise stated, a group selected from fluorine, chlorine, bromine or iodine.

The term "aryl" includes phenyl and naphthyl.

The term "heterocyclyl" is intended to mean a 4-7 membered monocyclic saturated or partially unsaturated aliphatic ring or a 4-7 membered saturated or partially unsaturated aliphatic ring fused to a benzene ring containing 1 to 3 heteroatoms selected from oxygen, nitrogen or sulphur. Suitable examples of such monocyclic rings include pyrrolidinyl, piperidinyl, piperazinyl, morpholinyl, tetrahydrofuranyl, diazepanyl and azepanyl. Suitable examples of benzofused heterocyclic rings include indolinyl, isoindolinyl, benzodioxolyl and dihydroisoquinolinyl.

The term "heteroaryl" is intended to mean a 5-7 membered monocyclic aromatic or a fused 8-11 membered bicyclic aromatic ring containing 1 to 3 heteroatoms selected from oxygen, nitrogen and sulphur. Suitable examples of such monocyclic aromatic rings include thienyl, furyl, pyrrolyl, triazolyl, imidazolyl, oxazolyl, thiazolyl, oxadiazolyl, isothiazolyl, isoxazolyl, thiadiazolyl, pyrazolyl, pyrimidyl, pyridazinyl, pyrazinyl, pyridyl and tetrahydropyranyl. Suitable examples of such fused aromatic rings include benzofused aromatic rings such as quinolinyl, isoquinolinyl, quinazolinyl, quinoxalinyl, cinnolinyl, naphthyridinyl, indolyl, indazolyl, pyrrolopyridinyl, benzofuranyl, benzothienyl, benzimidazolyl, benzoxazolyl, benzisoxazolyl, benzothiazolyl, benzisothiazolyl, benzoxadiazolyl, benzothiadiazolyl and the like.

Preferably, R<sup>1</sup> represents unsubstituted -C<sub>3-7</sub> cycloalkyl (eg. cyclobutyl, cyclopentyl or cyclohexyl), most preferably cyclobutyl or cyclopentyl.

Preferably, R<sup>2</sup> represents -X-aryl (eg. phenyl or benzyl), -X-heteroaryl, -X-heterocyclyl (eg. piperidinyl or -CH<sub>2</sub>-piperidinyl), -X-heterocyclyl-Y-aryl (eg. -piperidinyl-CO-phenyl optionally substituted by a cyano group), or -X-heterocyclyl-Y-heteroaryl (eg. -CH<sub>2</sub>-piperidinyl-CO-pyridyl).

Preferably, X represents a bond or -CH<sub>2</sub>-, most preferably -CH<sub>2</sub>-.

More preferably, R<sup>2</sup> represents -X-aryl, most preferably benzyl.

Preferably, n represents 0.

Preferred compounds according to the invention include examples E1-E3 as shown below, or a pharmaceutically acceptable salt thereof.

Compounds of formula (I) may form acid addition salts with acids, such as conventional pharmaceutically acceptable acids, for example maleic, hydrochloric, hydrobromic, phosphoric, acetic, fumaric, salicylic, sulphate, citric, lactic, mandelic, tartaric and methanesulphonic. Salts, solvates and hydrates of compounds of formula (I) therefore form an aspect of the invention.

Certain compounds of formula (I) are capable of existing in stereoisomeric forms. It will be understood that the invention encompasses all geometric and optical isomers of these compounds and the mixtures thereof including racemates. Tautomers also form an aspect of the invention.

The present invention also provides a process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt thereof, which process comprises:

- (a) reacting a compound of formula (II)

wherein  $R^1$ ,  $R^3$  and  $n$  are as defined above, with a compound of formula  $R^2-L^1$ , wherein  $R^2$  is as defined above for  $R^2$  or a group convertible thereto and  $L^1$  represents a suitable leaving group such as a halogen atom (eg. bromine or iodine) or an optionally activated hydroxyl group;

- (b) reacting a compound of formula (III)

wherein  $R^2$ ,  $R^3$  and  $n$  are as defined above, with a compound of formula  $R^1-L^2$ , wherein  $R^1$  is as defined above for  $R^1$  or a group convertible thereto and  $L^2$  represents a suitable leaving group such as a halogen atom (eg. bromine, iodine or tosylate); or

- (c) reacting a compound of formula (III) as defined above, with a ketone of formula  $R^1=O$ , wherein  $R^1$  is as defined above for  $R^1$  or a group convertible thereto; or

- (d) deprotecting a compound of formula (I) which is protected; and

- (e) interconversion to other compounds of formula (I).

When the leaving group  $L^1$  is attached to a  $sp^3$  hybridised carbon, for example,  $R^2-L^1$  is an alkyl halide, process (a) typically comprises the use of a suitable base, such as potassium carbonate in an appropriate solvent such as 2-butanone optionally in the presence of a transfer reagent such as potassium iodide at an appropriate temperature such as reflux.

When the leaving group  $L^1$  is attached to a  $sp^2$  hybridised carbon, for example,  $R^2-L^1$  is an aryl halide, process (a) typically comprises the use of a copper(I) salt, such as copper (I) iodide, in the presence of a base such as sodium hydride, in an appropriate solvent such as pyridine, at an appropriate temperature such as reflux.

When  $L^1$  is an optionally activated hydroxyl group attached to a  $sp^3$  hybridised carbon, for example,  $R^2-L^1$  is an alcohol, process (a) typically comprises the use of a phosphine such as

triphenylphosphine in a suitable solvent such as tetrahydrofuran, followed by addition of an azadicarboxylate such as diethylazodicarboxylate at a suitable temperature such as room temperature.

- 5 Process (b) typically comprises the use of a suitable base, such as potassium carbonate in an appropriate solvent such as 2-butanone optionally in the presence of a transfer reagent such as potassium iodide at an appropriate temperature such as reflux.

- 10 Process (c) typically comprises the use of reductive conditions (such as treatment with a borohydride eg. sodium triacetoxyborohydride), optionally in the presence of an acid, such as acetic acid, in an appropriate solvent such as dichloromethane at a suitable temperature such as room temperature.

- 15 In process (d), examples of protecting groups and the means for their removal can be found in T. W. Greene 'Protective Groups in Organic Synthesis' (J. Wiley and Sons, 1991). Suitable amine protecting groups include sulphonyl (e.g. tosyl), acyl (e.g. acetyl, 2',2',2'-trichloroethoxycarbonyl, benzyloxycarbonyl or t-butoxycarbonyl) and arylalkyl (e.g. benzyl), which may be removed by hydrolysis (e.g. using an acid such as hydrochloric acid in dioxan or trifluoroacetic acid in dichloromethane) or reductively (e.g. hydrogenolysis of a benzyl group or reductive removal of a  
20 2',2',2'-trichloroethoxycarbonyl group using zinc in acetic acid) as appropriate. Other suitable amine protecting groups include trifluoroacetyl (-COCF<sub>3</sub>) which may be removed by base catalysed hydrolysis or a solid phase resin bound benzyl group, such as a Merrifield resin bound 2,6-dimethoxybenzyl group (Ellman linker), which may be removed by acid catalysed hydrolysis, for example with trifluoroacetic acid.

- 25 Process (e) may be performed using conventional interconversion procedures such as epimerisation, oxidation, reduction, alkylation, nucleophilic or electrophilic aromatic substitution, ester hydrolysis or amide bond formation.

- 30 Compounds of formula (II) and (III) may be prepared in accordance with the following scheme

wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $n$  and  $L^1$  are as defined above and  $P^1$  represents a suitable protecting group such as Boc.

5

Step (i) typically comprises a deprotection reaction, for example, when  $P^1$  represents Boc the deprotection reaction comprises reaction of a compound of formula (IV) with an acid, for example hydrochloric acid in dioxan or trifluoroacetic acid in dichloromethane.

10 Step (ii) may be performed under reducing conditions in an analogous manner to that described for process (b).

Step (iii) may be performed in an analogous manner to that described for process (a).

15 Step (iv) typically comprises a deprotection reaction to provide a compound of formula (III) and can be performed as described in step (i).

Compounds of formula (IV) may be prepared in an analogous manner to those described in Description 3 of WO 02/40471.

20

Compounds of formula (I) and their pharmaceutically acceptable salts have affinity for the histamine H3 receptor and are believed to be of potential use in the treatment of neurological diseases including Alzheimer's disease, dementia, age-related memory dysfunction, mild cognitive impairment, cognitive dysfunction, epilepsy, neuropathic pain, inflammatory pain, Parkinson's disease, multiple sclerosis, stroke and sleep disorders including narcolepsy; psychiatric disorders including schizophrenia, attention deficit hyperactivity disorder, depression and addiction; and other diseases including obesity, asthma, allergic rhinitis, nasal congestion, chronic obstructive pulmonary disease and gastro-intestinal disorders.

Thus the invention also provides a compound of formula (I) or a pharmaceutically acceptable salt thereof, for use as a therapeutic substance in the treatment or prophylaxis of the above disorders, in particular neurodegenerative disorders including Alzheimer's disease.

The invention further provides a method of treatment or prophylaxis of the above disorders, in mammals including humans, which comprises administering to the sufferer a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof.

In another aspect, the invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for use in the treatment of the above disorders.

When used in therapy, the compounds of formula (I) are usually formulated in a standard pharmaceutical composition. Such compositions can be prepared using standard procedures.

Thus, the present invention further provides a pharmaceutical composition for use in the treatment of the above disorders which comprises the compound of formula (I) or a pharmaceutically acceptable salt thereof and a pharmaceutically acceptable carrier.

The present invention further provides a pharmaceutical composition which comprises the compound of formula (I) or a pharmaceutically acceptable salt thereof and a pharmaceutically acceptable carrier.

Compounds of formula (I) may be used in combination with other therapeutic agents, for example medicaments claimed to be useful as either disease modifying or symptomatic treatments of Alzheimer's disease. Suitable examples of such other therapeutic agents may be agents known to modify cholinergic transmission such as 5-HT<sub>6</sub> antagonists, muscarinic agonists or acetylcholinesterase inhibitors. When the compounds are used in combination with other therapeutic agents, the compounds may be administered either sequentially or simultaneously by any convenient route.

The invention thus provides, in a further aspect, a combination comprising a compound of formula (I) or a pharmaceutically acceptable derivative thereof together with a further therapeutic agent or agents.

The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above together with a pharmaceutically acceptable carrier or excipient comprise a further aspect of the invention. The individual components of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations.

When a compound of formula (I) or a pharmaceutically acceptable derivative thereof is used in combination with a second therapeutic agent active against the same disease state the dose of each compound may differ from that when the compound is used alone. Appropriate doses will be readily appreciated by those skilled in the art.

A pharmaceutical composition of the invention, which may be prepared by admixture, suitably at ambient temperature and atmospheric pressure, is usually adapted for oral, parenteral or rectal administration and, as such, may be in the form of tablets, capsules, oral liquid preparations, powders, granules, lozenges, reconstitutable powders, injectable or infusible solutions or suspensions or suppositories. Orally administrable compositions are generally preferred.

Tablets and capsules for oral administration may be in unit dose form, and may contain conventional excipients, such as binding agents, fillers, tableting lubricants, disintegrants and acceptable wetting agents. The tablets may be coated according to methods well known in normal pharmaceutical practice.

Oral liquid preparations may be in the form of, for example, aqueous or oily suspension, solutions, emulsions, syrups or elixirs, or may be in the form of a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous vehicles (which may include edible oils), preservatives, and, if desired, conventional flavourings or colorants.

For parenteral administration, fluid unit dosage forms are prepared utilising a compound of the invention or pharmaceutically acceptable salt thereof and a sterile vehicle. The compound, depending on the vehicle and concentration used, can be either suspended or dissolved in the vehicle. In preparing solutions, the compound can be dissolved for injection and filter sterilised before filling into a suitable vial or ampoule and sealing. Advantageously, adjuvants such as a local anaesthetic, preservatives and buffering agents are dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. Parenteral suspensions are prepared in substantially the same manner, except that the compound is suspended in the vehicle instead of being dissolved, and sterilisation cannot be accomplished by filtration. The compound can be sterilised by exposure to ethylene oxide before suspension in a sterile vehicle. Advantageously, a surfactant or wetting agent is included in the composition to facilitate uniform distribution of the compound.

The composition may contain from 0.1% to 99% by weight, preferably from 10 to 60% by weight, of the active material, depending on the method of administration. The dose of the compound used in the treatment of the aforementioned disorders will vary in the usual way with the seriousness of the disorders, the weight of the sufferer, and other similar factors. However, as a general guide suitable unit doses may be 0.05 to 1000 mg, more suitably 1.0 to 200 mg, and such unit doses may be administered more than once a day, for example two or three a day. Such therapy may extend for a number of weeks or months.

The following Descriptions and Examples illustrate the preparation of compounds of the invention.

#### **Description 1**

##### **7-Benzyloxy-1,2,4,5-tetrahydro-benzo[d]azepine-3-carboxylic acid *tert*-butyl ester (D1)**

7-Hydroxy-1,2,4,5-tetrahydro-benzo[d]azepine-3-carboxylic acid *tert*-butyl ester (PCT Int. Appl. (2002), WO 02/40471) (790mg, 3mmol), potassium carbonate (1.24g, 9mmol) and catalytic potassium iodide were suspended in 2-butanone (20ml). Benzyl bromide (536 $\mu$ L, 4.5mmol) was added and the mixture heated at reflux for 24 hours. The solids were filtered and then washed with acetone. The filtrate was concentrated *in vacuo* and the crude oil purified by column chromatography, eluting with a mixture of ethyl acetate and hexane (1:4) to afford the title compound (D1) (1.06g, 100%), <sup>1</sup>H NMR (CDCl<sub>3</sub>) 7.44 (5H, m), 7.03 (1H, d, J 8.1Hz), 6.77 (1H, s), 6.74 (1H, dd, J 8.1 & 2.4 Hz), 3.49 (4H, m), 2.84 (4H, m), 1.48 (9H, s).

#### **Description 2**

##### **7-Benzyloxy-1,2,4,5-tetrahydro-benzo[d]azepine (D2)**

7-Benzyloxy-1,2,4,5-tetrahydro-benzo[d]azepine-3-carboxylic acid *tert*-butyl ester (D1) (1.06g, 3mmol) was dissolved in dichloromethane (15ml) and treated with trifluoroacetic acid (15ml). The solution was stirred at room temperature for 2 hours, concentrated *in vacuo* and then twice co-evaporating with dichloromethane. The residue was dissolved in methanol and applied to a SCX (Varian bond-elute, 10g) and washed with methanol and then a mixture of .880 ammonia/methanol. The combined basic fractions were reduced *in vacuo* and the residue purified by column chromatography (1:9:40 .880 ammonia:ethanol:dichloromethane) to afford the title compound (D2) (702mg, 93%), MS (ES+) m/e 254 [M+H]<sup>+</sup>.

#### **Example 1**

##### **7-Benzyloxy-3-cyclopentyl-2,3,4,5-tetrahydro-1H-benzo[d]azepine (E1)**

7-Benzyloxy-1,2,4,5-tetrahydro-benzo[d]azepine (D2) (0.12g, 0.47 mmol) and cyclopentanone (0.11ml, 1.19 mmol) were dissolved in dichloromethane and stirred at room temperature for 20 minutes. Triacetoxysodiumborohydride (5.77g, 27.2mmol) and acetic acid (1 drop) were then added and the reaction was stirred for 18 hours. The mixture was then diluted with methanol and applied directly to a SCX ion exchange cartridge (Varian bond-elute) and washed with methanol and then a mixture of .880 ammonia and methanol (1:9). The basic fractions were combined then reduced *in vacuo* to afford the title compound; (0.148g, 98%), MS (ES+) m/e 322 [M+H]<sup>+</sup>.

### Examples 2-3

- 10 Examples 2-3 (E2-E3) were prepared from 7-benzyloxy-1,2,4,5-tetrahydro-benzo[d]azepine (D2) using an analogous method to that described in Example 1 with the appropriate ketone substituted for cyclopentanone as indicated in the table below:

Example	Aldehyde/Ketone	Mass Spectrum
7-Benzyloxy-3-cyclobutyl-2,3,4,5-tetrahydro-1H-benzo[d]azepine (E2)	cyclobutanone	MS (ES+) m/e 308 [M+H] <sup>+</sup>
7-Benzyloxy-3-cyclohexyl-2,3,4,5-tetrahydro-1H-benzo[d]azepine (E3)	cyclohexanone	MS (ES+) m/e 336 [M+H] <sup>+</sup>

### Biological Data

- 20 A membrane preparation containing histamine H3 receptors may be prepared in accordance with the following procedures:

#### (i) Generation of histamine H3 cell line

- The histamine H3 cDNA was isolated from its holding vector, pCDNA3.1 TOPO (InVitrogen), by restriction digestion of plasmid DNA with the enzymes BamH1 and Not-1 and ligated into the inducible expression vector pGene (InVitrogen) digested with the same enzymes. The GeneSwitch™ system (a system where in transgene expression is switched off in the absence of an inducer and switched on in the presence of an inducer) was performed as described in US Patent nos: 5,364,791; 5,874,534; and 5,935,934. Ligated DNA was transformed into competent DH5α *E. coli* host bacterial cells and plated onto Luria Broth (LB) agar containing Zeocin™ (an antibiotic which allows the selection of cells expressing the *sh ble* gene which is present on pGene and pSwitch) at 50μg ml<sup>-1</sup>. Colonies containing the re-ligated plasmid were identified by restriction analysis. DNA for transfection into mammalian cells was prepared from 250ml cultures of the host bacterium containing the pGeneH3 plasmid and isolated using a DNA preparation kit (Qiagen Midi-Prep) as per manufacturers guidelines (Qiagen).
- 35 CHO K1 cells previously transfected with the pSwitch regulatory plasmid (InVitrogen) were seeded at 2x10e6 cells per T75 flask in Complete Medium, containing Hams F12 (GIBCOBRL, Life Technologies) medium supplemented with 10% v/v dialysed foetal bovine serum, L-

glutamine, and hygromycin ( $100\mu\text{g ml}^{-1}$ ), 24 hours prior to use. Plasmid DNA was transfected into the cells using Lipofectamine plus according to the manufacturers guidelines (InVitrogen). 48 hours post transfection cells were placed into complete medium supplemented with  $500\mu\text{g ml}^{-1}$  Zeocin<sup>TM</sup>.

- 5 10-14 days post selection 10nM Mifepristone (InVitrogen), was added to the culture medium to induce the expression of the receptor. 18 hours post induction cells were detached from the flask using ethylenediamine tetra-acetic acid (EDTA; 1:5000; InVitrogen), following several washes with phosphate buffered saline pH 7.4 and resuspended in Sorting Medium containing Minimum Essential Medium (MEM), without phenol red, and supplemented with Earles salts and 3% Foetal
- 10 Clone II (Hyclone). Approximately  $1 \times 10^7$  cells were examined for receptor expression by staining with a rabbit polyclonal antibody, 4a, raised against the N-terminal domain of the histamine H3 receptor, incubated on ice for 60 minutes, followed by two washes in sorting medium. Receptor bound antibody was detected by incubation of the cells for 60 minutes on ice with a goat anti rabbit antibody, conjugated with Alexa 488 fluorescence marker (Molecular
- 15 Probes). Following two further washes with Sorting Medium, cells were filtered through a  $50\mu\text{m}$  Filcon<sup>TM</sup> (BD Biosciences) and then analysed on a FACS Vantage SE Flow Cytometer fitted with an Automatic Cell Deposition Unit. Control cells were non-induced cells treated in a similar manner. Positively stained cells were sorted as single cells into 96-well plates, containing Complete Medium containing  $500\mu\text{g ml}^{-1}$  Zeocin<sup>TM</sup> and allowed to expand before reanalysis for
- 20 receptor expression via antibody and ligand binding studies. One clone, 3H3, was selected for membrane preparation.

**(ii) Membrane preparation from cultured cells**

- 25 All steps of the protocol are carried out at  $4^{\circ}\text{C}$  and with pre-cooled reagents. The cell pellet is resuspended in 10 volumes of buffer A2 containing 50mM N-2-hydroxyethylpiperazine-N'-2-ethanesulfonic acid (HEPES) (pH 7.40) supplemented with  $10^{-4}\text{M}$  leupeptin (acetyl-leucyl-leucyl-arginal; Sigma L2884),  $25\mu\text{g/ml}$  bacitracin (Sigma B0125), 1mM ethylenediamine tetra-acetic acid (EDTA), 1mM phenylmethylsulfonyl fluoride (PMSF) and  $2 \times 10^{-6}\text{M}$  pepstatin A (Sigma). The cells are then homogenised by 2 x 15 second bursts in a 1 litre glass Waring
- 30 blender, followed by centrifugation at 500g for 20 minutes. The supernatant is then spun at  $48,000\text{g}$  for 30 minutes. The pellet is resuspended in 4 volumes of buffer A2 by vortexing for 5 seconds, followed by homogenisation in a Dounce homogeniser (10-15 strokes). At this point the preparation is aliquoted into polypropylene tubes and stored at  $-70^{\circ}\text{C}$ .

- 35 Compounds of the invention may be tested for *in vitro* biological activity in accordance with the following assays:

**(I) Histamine H3 binding assay**

For each compound being assayed, in a white walled clear bottom 96 well plate, is added:-

- 40 (a)  $10\mu\text{l}$  of test compound (or  $10\mu\text{l}$  of iodophenpropit (a known histamine H3 antagonist) at a final concentration of 10mM) diluted to the required concentration in 10% DMSO;
- (b)  $10\mu\text{l}$   $^{125}\text{I}$  4-[3-(4-iodophenylmethoxy)propyl]-1H-imidazolium (iodoproxyfan) (Amersham;  $1.85\text{MBq}/\mu\text{l}$  or  $50\mu\text{Ci/ml}$ ; Specific Activity  $\sim 2000\text{Ci/mmol}$ ) diluted to 200pM in

assay buffer (50mM Tris(hydroxymethyl)aminomethane buffer (TRIS) pH 7.4, 0.5mM ethylenediamine tetra-acetic acid (EDTA)) to give 20pM final concentration; and

- (c) 80µl bead/membrane mix prepared by suspending Scintillation Proximity Assay (SPA) bead type WGA-PVT at 100mg/ml in assay buffer followed by mixing with membrane (prepared in accordance with the methodology described above) and diluting in assay buffer to give a final volume of 80µl which contains 7.5µg protein and 0.25mg bead per well – mixture was pre-mixed at room temperature for 60 minutes on a roller.

The plate is shaken for 5 minutes and then allowed to stand at room temperature for 3-4 hours prior to reading in a Wallac Microbeta counter on a 1 minute normalised tritium count protocol.

- Data was analysed using a 4-parameter logistic equation.

### (II) Histamine H3 functional antagonist assay

For each compound being assayed, in a white walled clear bottom 96 well plate, is added:-

- (a) 10µl of test compound (or 10µl of guanosine 5'- triphosphate (GTP) (Sigma) as non-specific binding control) diluted to required concentration in assay buffer (20mM N-2-Hydroxyethylpiperazine-N'-2-ethanesulfonic acid (HEPES) + 100mM NaCl + 10mM MgCl<sub>2</sub>, pH7.4 NaOH);

- (b) 60µl bead/membrane/GDP mix prepared by suspending wheat germ agglutinin-polyvinyltoluene (WGA-PVT) scintillation proximity assay (SPA) beads at 100mg/ml in assay buffer followed by mixing with membrane (prepared in accordance with the methodology described above) and diluting in assay buffer to give a final volume of 60µl which contains 10µg protein and 0.5mg bead per well – mixture is pre-mixed at 4°C for 30 minutes on a roller and just prior to addition to the plate, 10µM final concentration of guanosine 5' diphosphate (GDP) (Sigma; diluted in assay buffer) is added;

- The plate is incubated at room temperature to equilibrate antagonist with receptor/beads by shaking for 30 minutes followed by addition of:

- (c) 10µl histamine (Tocris) at a final concentration of 0.3µM; and  
(d) 20µl guanosine 5' [ $\gamma$ 35-S] thiotriphosphate, triethylamine salt (Amersham; radioactivity concentration = 37kBq/µl or 1mCi/ml; Specific Activity 1160Ci/mmol) diluted to 1.9nM in assay buffer to give 0.38nM final.

- The plate is then incubated on a shaker at room temperature for 30 minutes followed by centrifugation for 5 minutes at 1500 rpm. The plate is read between 3 and 6 hours after completion of centrifuge run in a Wallac Microbeta counter on a 1 minute normalised tritium count protocol. Data is analysed using a 4-parameter logistic equation. Basal activity used as minimum i.e. histamine not added to well.

### Results

- The compounds of Examples E1-3 were tested in the histamine H3 functional antagonist assay and exhibited antagonism in the following range: 6.5-10.5 pK<sub>b</sub>. More particularly, the compound of Example 2 exhibited antagonism in the following range: 9.0-10.5 pK<sub>b</sub>.

## CLAIMS:

1. A compound of formula (I) or a pharmaceutically acceptable salt thereof:

wherein:

R¹ represents -C<sub>3-7</sub> cycloalkyl optionally substituted by C<sub>1-3</sub> alkyl;

R² represents -C<sub>1-6</sub> alkyl, -X-C<sub>3-8</sub> cycloalkyl, -X-aryl, -X-heterocyclyl, -X-heteroaryl, -X-C<sub>3-8</sub> cycloalkyl-Y-C<sub>3-8</sub> cycloalkyl, -X-C<sub>3-8</sub> cycloalkyl-Y-aryl, -X-C<sub>3-8</sub> cycloalkyl-Y-heteroaryl, -X-C<sub>3-8</sub> cycloalkyl-Y-heterocyclyl, -X-aryl-Y-C<sub>3-8</sub> cycloalkyl, -X-aryl-Y-aryl, -X-aryl-Y-heteroaryl, -X-aryl-Y-heterocyclyl, -X-heteroaryl-Y-C<sub>3-8</sub> cycloalkyl, -X-heteroaryl-Y-aryl, -X-heteroaryl-Y-heteroaryl, -X-heteroaryl-Y-heterocyclyl, -X-heterocyclyl-Y-C<sub>3-8</sub> cycloalkyl, -X-heterocyclyl-Y-aryl, -X-heterocyclyl-Y-heteroaryl, -X-heterocyclyl-Y-heterocyclyl;

X represents a bond or C<sub>1-6</sub> alkyl;

Y represents a bond, C<sub>1-6</sub> alkyl, CO, O or SO<sub>2</sub>;

R³ represents halogen, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy, cyano, amino or trifluoromethyl;

n is 0, 1 or 2;

wherein said C<sub>1-6</sub> alkyl, C<sub>3-8</sub> cycloalkyl, aryl, heteroaryl and heterocyclyl groups of R² may be optionally substituted by one or more substituents (eg. 1, 2 or 3) which may be the same or different, and which are selected from the group consisting of halogen, hydroxy, cyano, nitro, oxo, trifluoromethyl, trifluoromethoxy, fluoromethoxy, difluoromethoxy, C<sub>1-6</sub> alkyl, pentafluoroethyl, C<sub>1-6</sub> alkoxy, arylC<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkylthio, C<sub>1-6</sub> alkoxyC<sub>1-6</sub> alkyl, C<sub>3-7</sub> cycloalkylC<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkanoyl, C<sub>1-6</sub> alkoxy carbonyl, C<sub>1-6</sub> alkylsulfonyl, C<sub>1-6</sub> alkylsulfinyl, C<sub>1-6</sub> alkylsulfonyloxy, C<sub>1-6</sub> alkylsulfonylC<sub>1-6</sub> alkyl, sulfonyl, arylsulfonyl, arylsulfonyloxy, arylsulfonylC<sub>1-6</sub> alkyl, aryloxy, C<sub>1-6</sub> alkylsulfonylamido, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> alkylamido, -R⁴, -CO<sub>2</sub>R⁴, -COR⁴, C<sub>1-6</sub> alkylsulfonylamidoC<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkylamidoC<sub>1-6</sub> alkyl, arylsulfonylamido, arylcarboxamido, arylsulfonylamidoC<sub>1-6</sub> alkyl, arylcarboxamidoC<sub>1-6</sub> alkyl, aroyl, aroylC<sub>1-6</sub> alkyl, arylC<sub>1-6</sub> alkanoyl, or a group -NR⁵R⁶, -C<sub>1-6</sub> alkyl-NR⁵R⁶, -C<sub>3-8</sub> cycloalkyl-NR⁵R⁶, -CONR⁵R⁶, -NCOR⁵R⁶, -NSO<sub>2</sub>R⁵R⁶, -OCONR⁵R⁶, -NCO<sub>2</sub>R⁵R⁶, -NCONR⁵R⁶ or -SO<sub>2</sub>NR⁵R⁶ (wherein R⁴, R⁵ and R⁶ independently represent hydrogen, C<sub>1-6</sub> alkyl, -C<sub>3-8</sub> cycloalkyl, aryl, heterocyclyl or heteroaryl or -NR⁵R⁶ may represent a heterocyclyl group, wherein said R⁴, R⁵ and R⁶ groups may be optionally substituted by one or more substituents (eg. 1, 2 or 3) which may be the same or different, and which are selected from the group consisting of halogen, hydroxy, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy, cyano, amino, oxo or trifluoromethyl);

or solvates thereof.

2. A compound according to claim 1 which is a compound of formula E1-E3 or a pharmaceutically acceptable salt thereof.

3. A compound according to claim 1 or claim 2 for use in therapy.

4. A compound according to claim 1 or claim 2 for use in the treatment of Alzheimer's disease.

5

5. A pharmaceutical composition which comprises a compound according to claim 1 or claim 2 and a pharmaceutically acceptable carrier or excipient.
